                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to an isolated insulin homologue zins4 having composition family. The zins4 gene, located on chromosome compositions as a lata amino acid protein, where the zins4 polypeptide 1913:11, encodes a 142 amino acid protein, where the zins4 bolypeptide comprises a B chain and A chain comprising amino acid residues 26-52 and comprises a betain and A chain comprising amino acid residues 26-52 and comprises a betain and A chain comprising amino acid residues 26-52 and comprises a betain a chain and a chain and vasotropic activity. Zins4 has cytostatic, antifertility and vasotropic activity. Zins4 polypeptides and in therapies for treating reproductive disorders. Zins4 polypeptides and modulators of the inhibitors of its activity. Zins4 polypeptides and modulators of the inhibitors of its activity. Zins4 polypeptides and modulators of the inhibitors of its activity. Zins4 polypeptides and modulators of the inhibitors of its activity. Zins4 polypeptides and modulators of the inhibitors of its activity. Zins4 polypeptides and modulators of the control of the zins4 polypeptides and modulators of the pathological conditions and other reproductive function, ovulation, prostate, testicular cancer, fertility, ovarian polypetides in the pathological conditions and other reproductive function associated conditions are also useful for treating dysfunction associated conditions and cancer. The molecules are also useful for treating dysfunction, with contractile tissues or to suppress or enhance contractility in vivo.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         maturation of ovarian cells, myocytes, endothelial cells, osteoblasts in culture and in the study of the ovarian cycle, reproductive function, ovarian cell-cell interactions and fertilisation. The polypeptide is also useful as a modulator of blood pressure, muscle tension and osmotic balance. The zins4 polynucleotide is useful in gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       birth control, treating impotence or other male reproductive dysfunction, inducing birth, for promoting growth, differentiation, development and/or maturation of overian cells, myocytes, endothelial cells, osteoblasts in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New insulin homologue polypeptide having homology to relaxin family, designated zins4 and zins4 polynucleotide, useful for diagnosing, preventing, treating reproductive, prostate, heart and kidney disorders
                                                                                                                                                                                                                                                       /note= "Cleavage site at the junction of the C peptide and the A chain with a conserved RXXR motif"

The Zins3 protein is an insulin homologue protein. Polynucleotide cusing an expression vector. The cell will express an insulin homologue cusing an expression vector. The cell will express an insulin homologue polypeptide encoded by the polynucleotide. The polypeptides can also be conhuman animal. The polypeptides can be used to identify and isolate ceptors for zins3. Antibodies and antagonists of the polypeptides can ceptors for zins3. Antibodies and antagonists of the polypeptides can ceptors for zins3. Antibodies and antagonists of the polypeptides can cascotiated with the polypeptide, such as reproductive disorders.

C associated with the polypeptide, such as reproductive disorders can associated with the placenta and uterus, gastrointestinal diseases placental and colon pathology. Antagonists against the polypeptide may colon pathology. Antagonists against the polypeptide may colon pathology.
                                   61 EAMGDIFPDADADEDSLAGELDEAMGSSEWL------ALTKSPQAFYRGRPSWQ 108
                                                   Insulin homologue polypeptide(s) and antagonists - used to, e.g. treat pre-eclampsia, premature labour and Crohn's disease
                                                                                                                                                                                                                                                                      Insulin homologue; identification; isolation; Zins3 receptor; treatment; disease; pre-elampsia; premature labour; Human.

The Zins3 protein is an insulin homologue protein. Polynucleotide

CC molecules taken from its gene can be introduced into a cultured cell

CC using an expression vector. The cell will express an insulin homologue

CC polypeptide encoded by the polynucleotide. The polypeptides can also be

CC combuman animal. The polypeptides can be used to identify and isolate

CC receptors for zins3. Antibodies and antagonists of the polypeptides can

CC receptors for zins3. Antibodies and antagonists of the polypeptides can

CC receptors for zins3. Antibodies any also be used in extracellular matrix and

CC sosciated with the polypeptide, such as reproductive disorders

CC associated with the placenta and uterus, gastrointestinal diseases, and

CC placental and colon pathology. Antagonists against the polypeptide may

CC also be used to treat diseases such as preclampsia, premature labour, and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence represents an insulin-like polypeptide (pro-ILP).

CC The protein is expressed in the colon and uterus, and is a member cC of the insulin/GF family. The immature pro-ILP comprises a 135 amino cc acid sequence, which is processed into the mature form which comprises cC acid sequence, which is processed into the mature form which comprises cC and sequence, which is processed into the meture form which comprises of pro-ILP exists as a separate peptide after processing of pro-ILP. The exception is useful in treatment of disorders related to correct in treatment of disorders related to contropic activity, cardiovascular function, blood pressure, sommatic or cardiac homeostasis, cardiovascular function, blood pressure, sommatic or cardiac choncropic activity and collagen condition. The methods can be used for diagnosing a physiologic collagen condition of the uterus, colon or other ILP-expressing cell corrections and therapeutics.
                                                                                                                                                                                                                                                                                                                                                                                                 Insulin-like polypeptide; pro-ILP; ILP; insulin/IGF family; A chain; B chain; C chain; neurophysiological function; fluid homeostasis; electrolyte homeostasis; cardiovascular function; blood pressure; somatic; cardiac innotropic activity; cardiac chronotropic activity; cardiac chronotropic activity;

```
The present invention describes nucleic acids encoding PRO polypeptides useful for preventing, diagnosing and treating diagnosing acardiovascular, endothelial or angiogenic disorder in mammals by modulating cell proliferation, angiogenesis and cardiovascularisation, and for identifying agonists and antagonists of these processes. The roughles caids and the proteins they encode may be used in the prevention, treatment and diagnosis of diseases associated with anappropriate PRO expression such as cardiovascular, endothelial or angiogenic disorders in mammals (e.g. atherosclerosis, cancers and cardiac hypertrophy). For example, the nucleic acids (NCs) and vectors associated with decreased PRO expression. AAA77510 to AAA77721 and AAB24388 to AAB2438 represent nucleotide and protein sequences used in examplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                             Goddard A;

The present sequence is that of zins3, a novel member of the insulin/relaxin family. The zins3 gene maps to human chromosome to insulin/relaxin family. The zins3 gene maps to human chromosome (C insulin/relaxin family. The zins3 gene heritable form of non-linsulin dependent diabetes mellitus (MIDDM). Zins3 mRNA is not expressed in detectable amnounts in healthy tissue, indicating that the zins3 in detectable amnounts in healthy tissue, indicating that the zins3 polynucleotides and polypeptides can specialized cell type. Zins3 polynucleotides and polypeptides can be used to diagnose disorders associated with abnormal expression of the zins3 protein in the zins3 gene. In particular, the invention from mutations in the zins3 gene. In particular, the invention confirmation in the zins3 gene. In particular, the invention confirmation in the zins3 gene. In particular, the invention confirmation in glucose metabolism, such as NIDDM. Processing of the mature in glucose metabolism, such as NIDDM. Processing of the mature confirmation in involves cleavage at the C-terminus of the signal members of the insulin family, cleavage at the C-terminus of the remaining mand at the N-terminus of the A-chain, resulting in the N-mannial of the A-chain, resulting in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Identifying mutations in human chromosome 1p31, preferably a zins3 gene mutation, comprises using an insulin/relaxin family member (designated zins3), useful for diagnosing non-insulin dependent diabetes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 removal of the C-peptide. Cysteine residues at positions 29 and 41 (B-chain) and 121 and 121 and 135 (A-chain) are capable of associating through cysteine bridges and forming disulfide-bonded molecules.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Lok S;

5;
proteins from a variety of organisms, including human, dog, cat, horse, cow, pig, hamster, monkey, macaque, yeast, bacteria, fruit fly, sea urchin and tomator. These were derived from expressed sequence tags (ESTs) from the organism of interest. They can be used in diagnostics, forensics, gene mapping, identification of mutations, to assess biodiversity and for nutritional purposes. The present sequence is a protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human secretory and transmembrane; PRO; mammalian; cancer; lung; breast; prostate; cervical; tumour necrosis factor-alpha; TNF-alpha; cartilage; ear; proliferation; glucose; free fatty acid; skeletal muscle; adipocyte; A-peptide; factor VIIA; gene therapy.

ANULI72-AAU12446 represent novel human secretory and transmembrane

PRO polypeptides. The PRO polypeptides are useful to detect other

PRO polypeptides, to link bloactive molecules to cells expressing

PRO polypeptides, to modulate biological activities of cells expressing

PRO polypeptides, and to detect the presence of mammalian lung, colon,

Dreast, prostate, rectal, cervical or liver tumours by comparing PRO

Dreast, prostate, rectal, cervical or liver tumours by comparing PRO

Dreast, prostate, rectal, cervical or liver tumours by comparing PRO

The present sequence is that of PRO182 (UNQ156), a novel human commondulator protein encoded by CDNA (see AAF30052) isolated from a uterine cDNA library. The invention provides polynucleotides from a uterine cDNA library. The invention provides polynucleotides compositions comprising these proteins or including PRO182. Claimed compositions comprising these proteins or cells into a tissue of a mammal, stimulating or enhancing an immune crasponse in a mammal, or increasing the proliferation of Inflammatory crasponse in a mammal, or increasing the proliferation of T-lymphocytes in a mammal in response to an antigen. Claimed compositions comprising the PRO polypeptide or its antagonist have the opposite comprising the PRO polypeptide or its antagonist have the opposite comprising the PRO polypeptide or its antagonist have the opposite coup as a T cell disorder, involves administering the PRO polypeptide, such as a T cell disorder, involves administering the PRO polypeptide or treating an immune related disorder is selected from systemic lupus erythematosus, rheumatoid arthritis, csteparthris, juvenile chronic arthritis, spondyloarthropathy, csteparthris, juvenile chronic arthritis, spondyloarthropathy, csteparthris, and inflammatory myopathy in csteparthris, autoimmune thrombocytopaenia, thyroiditis, diabetes mellitus, immune-mediated renal disease, demyelinated diseases (such as immune-mediated colerosis), autoimmune chronic active hepatitis, primary commultiple sclerosis, grantlommune chronic active hepatitis, primary confliammatory bowel disease (ulcerative colitis and Crohn's disease), cf gluten-sensitive enteropathy, Whipple's disease, (auto)immune-mediated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Goddard A, Godowski PJ, Gurney AL;

PRO agonist or antagonist; a retroviral gene therapy vector comprising a PRO agonist or antagonist; a retroviral gene therapy vector comprising a PRO nucleic acid; and methods of inhibiting or stimulating endothelial cell growth, acrdiac hypertrophy or PRO-induced angiogenesis via the administration of a PRO protein, or an agonist or antagonist thereof. PRO nucleic acids, PRO proteins, antibodies against PRO proteins, PRO agonists and PRO antagonists may be used as therapeutic agents to treat cardiovascular, endothelial or angiogenic disorders, such as a therosclerosis, osteoporosis, myocardial infarction, hypertension, diabetic retinopathy, rheumatoid arthritis, Crohn's disease, psoriasis, chooses, wounds, cancer, Alzheimer's disease, Hutington's disease, or stroke. PRO nucleic acids are additionally useful in the recombinant production of PRO proteins, as hybridisation probes to screen libraries to isolate cDNAs with sequence identity to PRO proteins, to map genes encoding PRO proteins, to analyse genetic disorders, and in gene therapy. PRO nucleic acids can also be used to produce transgenic animals useful for the development and screening of potential
                                                                                                                                                                                                                                                                                                                                                          The invention relates to novel human anglogenesis-associated proteins designated PRO proteins (AAB53064-B53097), and to nucleic acids encoding PRO proteins. The invention also relates to vectors and host cells comprising a PRO nucleic acid, the recombinant production of a PRO protein, PRO antibodies specific for a PRO protein, description of a PRO protein, agonists or antagonists of a PRO protein, additionally encompasses methods of identifying modulators of PRO expression or activity; diagnosing a cardiovascular, endothelial or angiogenic disorder, or a susceptibility to such a disorder by detecting mutations in a PRO gene, or the expression level of a PRO gene within a particular tissue; treating a cardiovascular, endothelial or angiogenic disorder with the administration of a PRO protein.

                                                                                                                                                                                                                                                                                                         -1-SUBCELLULAR LOCATION: Secreted.
-1-ALTERNATIVE PRODUCTS: 2 isoforms; 1 (shown here) and 2; are produced by alternative splicing.
-1-TISSUE SPECIFICITY: Expressed in the ovary during pregnancy. Also expressed in placenta, decidua and prostate.
-1-SIMILARITY: BELONGS TO THE INSULIN/IGF/RELAXIN FAMILY.
                                                                                                                              Winslow J.W., Shih A., Bourell J.H., Weiss G., Reed B., Stults J.T., Goldsmith L.T.;

The invention relates to an isolated insulin homologue zins4 having

C fomology to the relaxin family. The zins4 gene, located on chromosome

CC 1913.11, encodes a 142 amino acid protein, where the Zins4 polypeptide

CC comprises a B chain and A chain comprising amino acid residues 26-52 and

CC comprises a B chain and A chain comprising amino acid residues 26-52 and

CC zins4 has cytostatic, antifertility and vasortopic activity. Zins4

CC zins4 has cytostatic, antifertility and vasortopic activity. Zins4

CC zins4 has cytostatic, antifertility and vasortopic activity. Zins4

CC zins4 has cytostatic, antifertility and vasortopic activity. Zins4

CC zins4 has cytostatic zins4 protein is useful in treating reproductive,

CC reproductive disorders. Zins4 protein is useful in treating of eproductive,

CC cell lines which respond to the zins4-stimulated pathway and to identify

CC inhibitors of its activity. Zins4 polypeptides and modulators of the

CC plypeptide are useful in treating disorders associated with gonadal

CC development, pregnancy, pubertal changes, menopause, ovarian cancer,

CD prostate, testicular cancer, fertility, ovarian function, ovulation,

CC prostate, testicular cancer, fertility, ovarian function, ovulation,

CC prostate, testicular cancer, fertility, ovarian function associated

CC prostate, testicular and patient is useful for diagnosing ovarian

CC prostate, testicular and patient is useful for diagnosing ovarian

CC serum or tissue blopsy of a patient is useful for treating disorders are also useful for treating disorders are contractility in vivo,

CC cancer. The molecules are also useful for treating disposing ovarian in the contractile tissues or to suppress or enhance contractility in vivo,

CC treating candiovascular disease, infertility, in vitro fertilization,

CC treating candiovascular disease, infertility, in vitro fertilization,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             birth control, treating importence or other male reproductive dysfunction, inducting birth, for promoting growth, differentiation, development and/or maturation of ovarian cells, myocytes, endothelial cells, osteoblasts in culture and in the study of the ovarian cycle, reproductive function, ovarian cell-cell interactions and fertilisation. The polypeptide is also useful as a modulator of blood pressure, muscle tension and osmotic balance. The zins4 polynucleotide is useful in gene therapy.
New insulin homologue polypeptide having homology to relaxin family, designated zins4 and zins4 polynucleotide, useful for diagnosing, preventing, treating reproductive, prostate, heart and kidney disorders
                                                                                                                                                                                                                                                                                                                                                                                                               Claim 6; Page 72-73; 79pp; English.

associated with the polypeptide, such as reproductive disorders associated with the placente and uterus, gastrointestinal diseases, and placental and colon pathology. Antagonists against the polypeptide may also be used to treat diseases such as preclampsia, premature labour, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The Zins3 protein is an insulin homologue protein. Polynucleotide molecules taken from its gene can be introduced into a cultured cell using an expression vector. The cell will express an insulin homologue polypeptide encoded by the polynucleotide. The polypeptides can also be expressed by introducing the polynucleotides into the germline of a nonhuman animal. The polypeptides can be used to identify and isolate nonhuman animal. Antibodies and antagonists of the polypeptides can be used for treating disease associated with extracellular matrix and be used for treating disease associated with extracellular matrix and vessels. The antibodies may also be used in the diagnosis of diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Insulin homologue polypeptide(s) and antagonists – used to, e.g. treat pre-eclampsia, premature labour and Crohn's disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence is that of a murine paralog (see AAY95771) of funnan zins3 (see AAY95770), a novel member of the insulin/relaxin family member that maps to a region of human chromosome 1 associated with non-insulin dependent diabetes mellitus (NIDDM). The sequence blots of embryo tissue indicated that mouse zins3 is expressed in a developmentally regulated fashion. Zins3 polynucleotides and a developmentally regulated fashion. Zins3 polynucleotides and abnormal expression of zins3, and to identify polynorphisms that result from mutations in the human zins3 gene. The invention provides methods for identifying abnormalities in expression that are a factor in causing, or predisposing, a person to some defect in glucose metabolism, such as NIDDM.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Identifying mutations in human chromosome 1p31, preferably a zins3 gene mutation, comprises using an insulin/relaxin family member (designated zins3), useful for diagnosing non-insulin dependent diabetes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  0; Gaps

New isolated relaxin-related factor genes - used to develop products which can be used in diagnosis and therapy, e.g. in fertility and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human relaxin-related factor-1 (RRF-1) (AAW17675) is a testis-specific growth factor related to relaxin and to the insulin family of ligands. RRF-1 cDNA (AAT66418) was isolated in a search of displays all the spected for sequences related to relaxin. RRF-1 partic. with regard to a cluster of four cysteine residues at the RRF-2 (AAW17676), has also been identified. RRF-1 cerminus of the molecule. A related placenta-specific factor, in transformed host cells for use in the prepn. of antibodies and therapeutic compens., or as a growth factor for maintaining cells in culture. RRF-1 may be involved in the maturation of sperm and have a role in treatment of fertility disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence is human zins2 testis-specific insulin homologue, which may be used to enhance the viability of cryopreserved sperm, sperm motility, egg/sperm interactions, fertilisation or proliferation or differentiation of testicular cells. Zins2 may also be used as a vaccine, e.g. in immunocontraception methods to prevent fertilisation. Antagonists, e.g. anti-zins2 binding protein, may be used in contraception. Zins2 is especially useful for in vitro fertilisation methods.

                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence is rat Zins2 testis-specific insulin man be used to enhance the viability of cryopreserved sperm, sperm motility, egg/sperm interactions, fertilisation or proliferation or differentiation of testicular cells. Zins2 may also be used as a vaccine, e.g. in immunocontraception methods to prevent fertilisation. Antagonists, e.g. anti-Zins2 binding protein, may be used in contraception. Zins2 is especially useful for in vitro fertilisation methods.

                                                                                                                                                                ŏ
                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The inventors claim synthetic porctine preprorelaxin and prorelaxin and synthetic A. B and C peptide chains of prolaxin, and a gene for units (see AAN30186). They also claim a double-stranded DNA fragment for the expression of the signal peptide chain of porcine preprorelaxin comprising a coding strand and a complementary strand corresp. to a defined mRNA sequence (see AAN30187-N30194) which sequences. A probe (AAN30195) is also claimed.
                                                                                                                                                                                                    Gaps
                                                                                  The genes
                                                                         The inventors claim synthetic genes for porcine relaxin. The genes may contain, in addn to the coding sequence, a stop codon, an initiator methionine codon, restriction sites for Cla I and Bam HI etc. Porcine relaxin is useful in the induction and control of labour in women. In sows admin. during farrowing may reduce the rate of still birth of piglets.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Genes and DNA transfer vectors for prorelaxin expression - useful in prodn. of porcine relaxin for veterinary and human use
                                                                                                                                                                                                    ;
